# Forest Health Indicator: Tree and Crown Condition 

Name(s): $\qquad$
Location: $\qquad$

Damage to trees from disease, weather, and activity by animals, insects, and humans can affect overall forest health. Several of these signs are included in the chart below.

## Materíals

Paper, pencils, chalk

## Method

Count all the trees in the plot, marking the trees with colored chalk to help you keep track. Note trees that have one or more signs of disease or damage (see below). To count it as diseased or damaged, 10 percent or more of the tree should be affected. Calculate the percentage of all trees in the plot that have such signs.

| Sign | Signs of Disease or Damage |
| :--- | :---: |
| What it may indicate |  |
| Tree has ragged leaves with holes | Insects feeding on the leaves |
| Black or brown leaves | Stem or leaf disease |
| Spots or bumps on leaves | Insects and mites |
| Twisted or malformed leaves | Insects and disease, herbicides |
| Leaves changing color before fall | Trunk or root damage, drought, pollution |
| Branch decay | Unhealed wounds |
| Peeling or broken bark, holes in the bark | Trunk wound, canker disease, or damage caused by humans or animals |
| Dying branches on one side of crown | Root decay, root injury or internal stem disease, insect attack |
| Canker la dead section of a trunk or branch) | Fungal infections |
| Splits | Broken branches |
| Hollows | Water entering through old wounds and supporting wood decay by fungi |
| Fungi or mushrooms growing on tree | Internal decomposition of wood by fungi |
| Green or brown spots on needles | Air pollution |

## Results

Total number of trees with signs of disease or damage in plot: $\qquad$ (Value A)
Total number of trees in plot: $\qquad$ (Value B)
Percentage of trees damaged $=($ Value $A \div$ Value B) $\times 100=$ $\qquad$ percent

## Rating

|  |  | Tree and Crown Condition |  |
| :--- | :--- | :--- | :--- | :--- |
| Rating | $\vdots$ | Description | Points |
| Good | Less than 25 percent of trees have damage | 3 |  |
| Fair | $25-50$ percent of trees have damage | 2 |  |
| Poor | Greater than 50 percent of trees have damage | 1 |  |

Overall Tree and Crown Condition rating for sample plot:

## STUDENT PAGE

## Forest Health Indicator: Forest Diversity

Name(s): $\qquad$

Location: $\qquad$
Date: $\qquad$

A healthy forest includes a variety of different plants and animals. One way to assess this diversity is to determine whether there is a mix of plant species of different sizes and ages, thus creating forest "layers" that provide habitat for many species.

## Materíals

Pencil, paper, tape measure, chalk, tree identification guide (optional)

## Method

Look at the leaves, bark, seed pods, or flowers of the trees in your forest plot to determine whether they are the same or different species. Use the Tree Species Diversity chart below to catalog this information. Tree identification guides are helpful with this step, but not necessary. If a tree identification guide is not available, use your observation skills to describe the differences in tree types and include this information in the Tree Species Diversity chart below.

Measure (or estimate) the diameter at breast height (DBH) for all trees in the sample plot. Count (or estimate) the number of trees of different size classes using the corresponding DBH size classifications found in the Size Diversity chart below and record your findings. To help you, consider using chalk to mark the trees you have already counted.

Assess the presence or absence of different forest layers, using the descriptions found in the Forest Layer Diversity chart and record your findings.

## Results

Tree Species Diversity

|  | Name or Description | Number found in sample plot |
| :---: | :---: | :---: |
| Species 1 |  |  |
| Species 2 |  |  |
| Species 3 |  |  |
| Species 4 |  |  |
| Species 5 |  |  |

Note: Please continue listing to account for all species present in sample plot.

| Size Size | Siversity |  |
| :--- | :--- | :--- |
| DBH | Number found in sample plot |  |
| Saplings or Poles | $4-9$ inches $(10-24 \mathrm{~cm})$ | $\vdots$ |
| Small | $10-14$ inches $(25-37 \mathrm{~cm})$ |  |
| Medium | $15-19$ inches $(38-49 \mathrm{~cm})$ |  |
| Large | $20-29$ inches $(50-75 \mathrm{~cm})$ |  |
| Giant | 30 inches or greater $(>75 \mathrm{~cm})$ |  |

## Forest Health Indicator: Forest Diversity (cont.)

| Forest Layer Diversity |  |  |
| :---: | :---: | :---: |
| Tree Layer | Description | Present in sample plot? (Yes/ No) |
| Overstory | Trees whose canopies are fully exposed to the sun |  |
| Understory | Trees growing in the shade of other trees |  |
| Tall shrub | Shrubs (woody plants with several stems arising from the base) greater than 6 feet ( 1.8 meters) in height |  |
| Short shrub | shrubs less than 6 feet (1.8 meters) in height |  |
| Forb | herbaceous (non-woody) plants such as ferns, wildflowers, and grasses |  |
| Leaf litter | Dead and decaying leaves and other matter on the forest floor |  |

Rating

| Tree Species Diversity |  |  |  |
| :---: | :---: | :---: | :---: |
| Rating | Description | Points |  |
| Good | Three or more tree species present | 3 |  |
| Fair | Two tree species present | 2 |  |
| Poor | One tree species present | 1 |  |
| Tree Species Diversity rating for sample plot: |  |  | (Value A) |

| Size Diversity |  |  |  |
| :---: | :---: | :---: | :---: |
| Rating | Description | Points |  |
| Good | Three or more size classes present | 3 |  |
| Fair | Two or size classes present | 2 |  |
| Poor | One size class present | 1 |  |
| Size Diversity rating for sample plot: |  |  | (Value B) |

|  |  | Forest Layer Diversity |  |
| :--- | :--- | :--- | :--- | :--- |
| Rating | Description | $\vdots$ | Points |
| Good | Five or six layers present | 3 |  |
| Fair | Three or four layers present | 2 |  |
| Poor | One or two layers present | 1 |  |
|  | Forest Layer Diversity rating for sample plot: |  |  |

## Overall Rating

Determine the overall rating by adding up the points shown for the tree species, size, and forest layer diversity ratings; then dividing the total by 3 . Round the total to the nearest whole number.
(Value A + Value B + Value C) $\div 3=$ $\qquad$ (Average point value)

Overall rating for Forest Diversity:
Good: Average point value of 3 Fair: Average point value of 2 Poor: Average point value of 1

## Overall Forest Diversity rating for sample plot:

## Forest Health Indicator: Lichen Abundance

Name(s): $\qquad$

Location: $\qquad$
Date: $\qquad$

Lichens often grow on trees and shrubs, absorbing nutrients from the atmosphere. Because lichens are very sensitive to air pollution-particularly to sulfur dioxide, fluoride, and ammonia-their presence or absence is an indicator of forest health. The acidity of a tree's bark can also affect lichen abundance.

A lichen is actually two different organisms-either a fungus and an alga, or a fungus and a cyanobacterium—living in a symbiotic relationship. The fungus provides protection and moisture, while the alga or cyanobacterium provides food through photosynthesis.

## Materials

String, tape measure, compass, chalk, 100-circle grid transparency

## Method

Select 10 trees on your study plot to sample. For each tree, tie a string around the trunk at a standard height (such as diameter at breast height, or DBH). Use a compass to determine north, south, east, and west; then mark the directions with chalk on the tree at the string line.

At each of the 4 directions, place the 100-Circle Grid Transparency against the tree, and count the number of circles in which lichens are showing. That number represents the percentage of lichen coverage. For each tree, find the average lichen coverage by

Trees help support many other living organisms, including these lichens. Far from harming the tree, lichens indicate pollution-free air. Photo by USDA Forest Service - Northeastern Area Archive, USDA Forest Service. totaling the lichens found within the circles and then dividing the total by 4 . Find the total average lichen coverage of the plot.

## Results

For each tree and direction, record the number of circles that show lichens. This number represents the percentage of lichen coverage.

## Forest Health Indicator: Lichen Abundance (cont.)

| Lichen Abundance |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | North | East | South | West | Total | Tree Average (\%) |
| Tree 1: |  |  |  |  |  |  |
| Tree 2: |  |  |  |  |  |  |
| Tree 3: |  |  |  |  |  |  |
| Tree 4: |  |  |  |  |  |  |
| Tree 5: |  |  |  |  |  |  |
| Tree 6: |  |  |  |  |  |  |
| Tree 7: |  |  |  |  |  |  |
| Tree 8: |  |  |  |  |  |  |
| Tree 9: |  |  |  |  |  |  |
| Tree 10: |  |  |  |  |  |  |
| Totals: |  |  |  |  |  |  |
| Average: |  |  |  |  |  |  |

Add up the tree averages, which will be recorded in the final column in the chart above. Divide this total by the number of trees sampled to get the average lichen coverage for the entire sample plot.

Average Lichen Coverage for sample plot: $\qquad$ percent

## Rating

| Lichen Abundance |  |  |
| :---: | :---: | :---: |
| Rating | Description | Points |
| Good | Greater than 5 percent lichen coverage | 3 |
| Fair | 3-5 percent lichen coverage | 2 |
| Poor | 0-2 percent lichen coverage | 1 |
| Overall Lichen Abundance rating for sample plot: |  |  |

# Forest Health Indicator: Soil Quality 

Name(s): $\qquad$
Location: $\qquad$

The quality of the soil in a forest is an important indicator of forest health. How well the soil functions directly influences the health of the trees and other forest organisms. An evaluation of soil quality usually involves measuring the soil's physical, chemical, and biological makeup at different depths.

## Materials

Spade or trowel, 3 paper cups or plastic bags, distilled water, eyedropper, 3 Petri dishes or plastic containers, pH paper, white paper

## Method

Choose a soil sample site that represents the overall forest plot, and measure 1 square foot ( 0.09 square meters) of ground, marking the corners with sticks or rocks. Within the plot, first remove the leaf litter layer with a spade or trowel. Next, collect soil samples from depths of approximately 3 inches ( 7.5 cm ), 6 inches $(15 \mathrm{~cm})$, and 1 foot ( 30 cm ). Use paper cups or plastic bags to store the samples.

Conduct the following assessments for each sample, recording your results in the "Soil Quality Results and Ratings" chart below.

## Results

## Soil Type

Most soils are a mixture of sand, silt, and clay. The specific content of a given soil influences how well it holds nutrients and water. To find out your soil type, take a small amount of soil (about the size of a marble), and moisten it with a few drops of water. Squeeze it between your thumb and fingers.

| Soil Types |  |  |
| :---: | :---: | :---: |
| Soil Type | Squeezed Moist Soil | Rating |
| Sand | Feels gritty and cannot hold ball shape | Poor-Has few nutrients, holds little water, and is prone to drought |
| Sandy Loam | Can be molded into a ball, but ball breaks up easily | Good-Has good balance of nutrients and moisture retention |
| Silt | Can be molded into a ball that is easily deformed; does not feel gritty and has silkiness like flour | Fair-Has more nutrients and holds more water than sand, but washes away (erodes) easily |
| Loam | Can be molded into a ball that can be handled quite freely without breaking | Good-Has good balance of nutrients and moisture retention |
| Clay Loam | Can be formed into a long thin rod or "ribbon" that will break readily, barely sustaining its own weight | Good-Has good balance of nutrients and moisture retention |
| Clay | Sticky and can easily be formed into long thin rod or "ribbon" | Fair-Holds water very well, but does not allow movement of air or water, so doesn't drain well |

Record your results in the "Soil Quality Results and Ratings" chart.

# Forest Health Indicator: Soil Quality (cont.) 

## Soil pH

Soil pH is a measure of how acidic or alkaline the soil is, and it is an indicator of soil quality. Measure 1 tablespoon of soil from each depth, place this amount onto individual Petri dishes or plastic containers, and label the soil samples. Wet each soil sample with 5 drops of distilled water, and allow it to sit for 3 to 5 minutes. Place one piece of pH paper on each soil sample. Determine the approximate pH of your soil.

| Soil pH |  |  |
| :---: | :---: | :---: |
| Rating | Description | Points |
| Good | pH of 5.51-7.2, which is optimum for many plant species | 3 |
| Fair | pH of 7.2-8.5 (moderately alkaline) or 4.0-5.5 (moderately acid) | 2 |
| Poor | pH of 4.0 and less (acid), or greater than 8.5 (alkaline) | 1 |

Record your results in the "Soil Quality Results and Ratings" chart.

## Soil Organisms

The presence of living organisms in the soil is an important indicator of productive soils. Soil organisms aid in nutrient cycling, soil creation, and decomposition of organic matter and dead organisms. Pour the remaining soil sample onto a white piece of paper, and look for the presence of the following organisms. For each type, circle whether it is present or not. (Soil fungi are microscopic cells that grow as long threads or strands in the soil.)

| Soil Organisms |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Soil Depth | Ants/ Termites |  | Centipedes/ Millipedes |  | Earthworms |  | Fungi |  | Other | Other |
| 3 in (7.5 cm) | Present | None | Present | None | Present | None | Present | None |  |  |
| 6 in ( 15 cm ) | Present | None | Present | None | Present | None | Present | None |  |  |
| $12 \mathrm{in}(30 \mathrm{~cm})$ | Present | None | Present | None | Present | None | Present | None |  |  |

| Soil Organisms |  |  |
| :---: | :---: | :---: |
| Rating | Description | Points |
| Good | 3 or more types of soil organisms present in soil sample | 3 |
| Fair | 1 or 2 types of organisms present in soil sample | 2 |
| Poor | no soil organisms present in soil sample | 1 |

Record your results in the "Soil Quality Results and Ratings" chart.

# Forest Health Indicator: Soil Quality (cont.) 

## Rating

Circle the ratings that apply for each depth and each assessment. Determine the average score for each depth by adding up the points shown for each rating and dividing the total by 3 . Find the average of the three "Average Soil Quality at Each Depth" ratings to get the overall soil quality.

| Soil Ouality Results and Ratings |  |  |  |
| :---: | :---: | :---: | :---: |
|  | $3 \mathrm{in}(7.5 \mathrm{~cm})$ deep | 6 in ( 15 cm ) deep | $12 \mathrm{in}(30 \mathrm{~cm})$ deep |

# Forest Health Indicator: Regeneration 

Name(s): $\qquad$
Location: $\qquad$
Date: $\qquad$

Forest regeneration is a good measure of the health of the forest habitat. When a forest can produce enough young trees to replace the canopy trees when they are cut, blown down, or die, such production is an indication that the forest is vibrant and sustainable. An overabundance of regeneration, however, can result in competition for limited resources among adjacent trees. Regeneration is measured by the number of tree seedlings present.

## Materials

Tape measure, string or other marker

## Method

Using a tape measure and string or other marker, divide the study plot into 9 equal segments (8 equal segments, if it is a circle plot). Survey each segment and determine whether there is a healthy seedling that is at least 12 inches (30 $\mathrm{cm})$ tall if it is a conifer, and at least 39 inches (1 meter) tall if it is a deciduous tree. To be considered healthy, the seedling must not have any apparent damage to its leaves or stems.

## Results

Coniferous seedling

Number of forest plot segments with at least one healthy seedling: $\qquad$ (Value A) Number of total forest plot segments: $\qquad$ (Value B)

Percentage of plots with at least one healthy seedling (Value A $\div$ Value B) $\times 100=$ $\qquad$ percent

## Rating

## Plot Segments

| Rating |  | Pescription | Points |  |
| :--- | :--- | :--- | :--- | :--- |
| Good | More than 66 percent of plot segments have at least one healthy seedling. | 3 |  |  |
| Fair | 33 to 66 percent of plot segments have at least one healthy seedling. | 2 |  |  |
| Poor | Less than 33 percent of plot segments have at least one healthy seedling. | 1 |  |  |
| Overall Regeneration rating for sample plot: |  |  |  |  |

## Forest Health Indicator: Snags and Coarse Woody Debris

Name(s): $\qquad$
Location: $\qquad$

In natural forest ecosystems, snags (standing dead trees) and coarse woody debris (dead logs and large branches on the ground) are important indicators of forest health. Their presence indicates a forest of diverse ages, and the snags and debris provide animal habitat, energy and nutrient cycling, and stable soils.

Note: In parks or near structures, forest managers may remove snags or coarse woody debris to prevent fire and other safety hazards. If your forest plot is in such an area, the presence of snags or debris may not be a relevant forest health indicator.

## Materials

Tape measure

## Method

Count the number of snags and the number of live trees in your forest plot, and calculate the percentage of standing trees that are snags. Then, count the number of dead logs and downed large branches in your plot that are more than 4 inches ( 10 cm ) in diameter and more than 39 inches ( 1 m ) in length, and calculate their abundance.

## Results

## Snags

Number of snags in plot: $\qquad$ (Value A)
Number of live trees in plot: $\qquad$ (Value B)

Total number of standing trees in plot:
Value A + Value B = $\qquad$ (Value C)

Percentage of snags:
(Value A $\div$ Value C) $\times 100=$ $\qquad$ percent (Value D)

## Coarse Woody Debris

Number of logs and downed branches greater than 4 inches ( 10 cm ) in diameter and 39 inches ( 1 m ) in length: $\qquad$ (Value E)

Abundance of course woody debris:
(Value E $\div$ Value B) $\times 100=$ $\qquad$ percent (Value F)
(Note: For some forest plots, abundance may be more than 100 percent.)

## Forest Health Indicator: Snags and Coarse Woody Debris (cont.)

Rating

| Snags |  |  |
| :---: | :---: | :---: |
| Rating | Description | Points |
| Good | From 10 to 15 percent of standing trees are snags. | 3 |
| Fair | From 5 to 10 percent of standing trees are snags. | 2 |
| Poor | Fewer than 5 percent of standing trees are snags. | 1 |
|  | Snags rating for sample plot | points (Value G) |

| Coarse Woody Debris |  |  |
| :---: | :---: | :---: |
| Rating | Description | Points |
| Good | More than 15 percent abundance of coarse woody debris. | 3 |
| Fair | $\vdots$ From 5 to 15 percent abundance of coarse woody debris. | 2 |
| Poor | ! Fewer than 5 percent abundance of coarse woody debris. | 1 |
|  | Coarse Woody Debris rating for sample plot | points (Value H) |

## Overall Rating

Determine the overall rating by adding up the points shown for the snag and coarse woody debris ratings, and then divide the total by 2 . Round to the nearest whole number.
(Value G + Value H) $\div 2=$ $\qquad$
Good: Average point value of 3
Fair: Average point value of 2
Poor: Average point value of 1
Overall Snags and Coarse Woody Debris rating for sample plot: $\qquad$

## Source

National Park Service. 2009. "Forest Health: Course Woody Debris and Snags." Resource Brief, Northeast Temperate Network. http://science.nature.nps.gov/im/units/NETN/Education/Resource\ Briefs/NETN_RB_CWDSnags_FINAL.pdf

## Forest Health Indicator: wildlife

Name(s): $\qquad$
Location: $\qquad$
Date $\qquad$

The presence of a variety of wildlife is an indicator that a forest is vibrant and healthy. Actually seeing the animals may be difficult, but tracks, droppings, burrows, dens, nests, chewed leaves, and other evidence or "signs" reveal their existence. You are more likely to see or hear the animals if you are quiet, respectful, and patient.

## Materials

Pencil, paper, binoculars or magnifying glass (optional)

## Method

In your forest plot, look on the ground, under shrubs, and in trees for mammals, birds, reptiles, amphibians, spiders, or insects, or for signs of those animals. Record your observations.
Results

| Animal Signs and Sightings |  |  |
| :---: | :---: | :---: |
| Animal Class | Signs | Sightings |
| Mammals |  |  |
| Birds |  |  |
| Reptiles |  |  |
| Amphibians |  |  |
| Spiders |  |  |
| Insects |  |  |
| Other |  |  |

Rating

| Wildilife |  |  |
| :---: | :---: | :---: |

$\qquad$

Explain your reasoning.

## Evaluating Tree Benefits

Name(s): $\qquad$

Location: $\qquad$
Date: $\qquad$

1. Select a tree to study. Use a field guide or other source to determine the tree's species.

Tree Species: $\qquad$
2. Determine the tree's diameter at breast height (DBH), and then measure the tree's height. Methods for collecting these measurements are described at the end of this student page.

DBH: $\qquad$ inches (or $\qquad$ cm)

Height: $\qquad$ feet (or $\qquad$ m)
3. Visit the Tree Benefits website (http://www.treebenefits.com) to determine the ecological services that your selected tree provides by entering the species name and DBH (in inches).

Record your findings below.

## Overall Benefits

At current size: \$ $\qquad$ a year
If it continues to grow: \$ $\qquad$ a year

## Stormwater

$\qquad$ gallons of storm water intercepted a year

Property Value
\$ $\qquad$

## Energy

Electricity conserved (for cooling): $\qquad$ kilowatt/hours
Oil/Natural gas conserved (for heating): $\qquad$ therms

## Air Quality

Ozone $\left(\mathrm{O}_{3}\right)$, deposited: $\qquad$
Volatile Organic Chemicals (VOC), avoided: $\qquad$
Nitrogen Dioxide $\left(\mathrm{NO}_{2}\right)$, deposited: $\qquad$
Nitrogen Dioxide $\left(\mathrm{NO}_{2}\right)$, avoided: $\qquad$
Sulfur Dioxide $\left(\mathrm{SO}_{2}\right)$, deposited: $\qquad$
Sulfur Dioxide $\left(\mathrm{SO}_{2}\right)$ avoided: $\qquad$
Particulates less than 10 microns ( $\mathrm{PM}_{10}$ ), deposited: $\qquad$
Particulates less than 10 microns ( $\mathrm{PM}_{10}$ ), avoided: $\qquad$
Carbon Dioxide ( $\mathrm{CO}_{2}$ )
Total pounds of atmospheric carbon reduced: $\qquad$
4. Describe any other ecosystem services or benefits provided by this tree.

## Evaluating Tree Benefits (cont.)

## How to Measure Díameter at Breast Height

Because some trees may be much wider at the base than others, foresters measure tree diameter using a standard called Diameter at Breast Height—or DBH. The DBH is the diameter of the tree at 4.5 feet (1.4 meters) above the ground.

First, use a tape measure to determine the circumference of the tree at 4.5 feet ( 1.4 meters) above the ground. This measurement is the Circumference at Breast Height (CBH). To obtain the diameter at breast height (DBH), divide the CBH by 3.14 (or $\pi$ ). The Tree Benefits website requires this measurement to be in inches.
$\mathrm{CBH} \div 3.14=\mathrm{DBH}$

Foresters often use tools, such as a diameter tape or a biltmore stick, to measure diameter directly.

## How to Measure Tree Height

One of the simplest methods for measuring a tree's height is setting up a proportion.

- Have a friend stand at the base of the tree while you walk a distance away from it.
- Hold a ruler at arm's length. Walk backward or forward until both the top and bottom of the ruler line up with the top and bottom of the tree.
- Note how tall your friend appears on the ruler (for example, 5 cm ).
- Divide the length of the ruler by the apparent height of your friend. (For example, if the ruler is 30 cm , you would divide that number by the 5 cm from above, to get 6.)
- Multiply this number by the actual height of your friend. The result is the height of the tree. (For example, if your friend is 140 cm tall, you would multiply by 6 , from above, to get 840 cm , or 8.4 m .)
